

Abstract of the disclosure

Abstract of the disclosure

A LCD module and a scanning method of the LCD panel and its scanning circuit board. The main object is to configure a first scan driver circuit and a second scan driver circuit at both ends of each of the scanning line in the LCD panel respectively. During scanning, both the first scan driver circuit and the second scan driver circuit are used for carrying out the scanning procedure on every scanning line, therefore the delay effect caused by RC time constant is equivalently reduced. The first scan driver circuit and the second scan driver circuit allocated to the scanning circuit boards have the same circuit layout.
